Marketing25 — QA test script

A manual pass over everything a pharmacy can do. Work top to bottom; each case is self-contained, so you can stop and resume.

Before you start, read the *For QA* section of `TEST-ENVIRONMENT.md` — how to sign in, which demo account is which, and how to report what you find. This document is only the *what to try*.

How to use this

Each case has an **ID**, what to **do**, and what **should** happen. Record `PASS`, `FAIL` or `N/A` and a note. A case that cannot be run — feature not deployed, no data — is `N/A`, not PASS.

Only ever mark PASS on what you actually saw. A case you skipped and assumed fine is the one that ships broken.

Column	Meaning
Env	`TEST` only, `PROD` only, or `BOTH`
Sev	**S1** data loss, wrong pharmacy's data, or nobody can work. **S2** a main task is blocked. **S3** wrong but workable. **S4** cosmetic.

Reporting

Three things make a report actionable: what you did, what you expected, what happened. Screenshot the **whole window** — the URL and any banner are usually the useful part.

Report immediately, stop testing, and say so loudly if you ever see data belonging to a pharmacy you are not signed in as. That is S1 and it outranks finishing the script.

Testing against production — read this first

Most of this script is safe on production. These are not.

Do not	Why
Send a campaign to anyone but yourself	Real patients receive real email. Add your own address as a manual recipient; never use a pharmacy's real list.
Import a contact list	It lands in a real pharmacy's audience and there is no bulk undo.
Delete anything you did not create in the last five minutes	No undo, and posters are referenced by campaigns.
Use a real patient's name, address or phone as test data	Even on TEST. It is not protected the way production is.
Test plan limits by upgrading or downgrading a live account	It bills them.
Deactivate an account	Locks out a real pharmacy.

Cases marked **TEST** are the ones that need a throwaway account or a plan change. On production, mark them `N/A — production`.

Production also sends real email. Anything that triggers a message — signup, invitations, password reset, campaigns — will arrive in a real inbox. Use an address you own.

1. Getting in

ID	Env	Sev	Do	Should	Result
1.1	BOTH	S1	Sign in with a valid pharmacy account	Lands on the dashboard, pharmacy name in the header	
1.2	BOTH	S2	Sign in with a wrong password	Refused with a message; **no hint as to whether the address exists**	
1.3	TEST	S2	Sign in as `elmtree@example.test` (deactivated)	Refused. A deactivated account must not get in	
1.4	BOTH	S3	On every password box, press the show/hide control	Reveals and re-hides. Check sign-in, sign-up, reset, and invitation activation	
1.5	BOTH	S1	Sign out	Returns to sign-in **with the signed-in sidebar gone**. Press Back — you must not see the app again	
1.6	BOTH	S2	While signed out, open `/dashboard` directly	Sent to sign-in, not shown the page	

Password reset

ID	Env	Sev	Do	Should	Result
1.7	BOTH	S2	"Forgot password?", submit your own address	A reset email arrives. The link opens a set-password page	
1.8	BOTH	S2	Set a new password, then sign in with it	Works	
1.9	BOTH	S1	Before resetting, sign in on a second browser. Reset. Return to the second browser and click about	**You are signed out there too.** Resetting revokes every session — that is the point of it	
1.10	BOTH	S3	Check your inbox after 1.8	A separate email confirms the password changed. This is the only warning a real owner gets if it was not them	
1.11	BOTH	S2	Request a reset for an address that does not exist	The page says the same thing as for a real one. It must not confirm who has an account	

2. Signing up and onboarding

ID	Env	Sev	Do	Should	Result
2.1	TEST	S1	Register a new account	Welcome email arrives; you land in onboarding	
2.2	BOTH	S3	On sign-up, enter two different passwords	Refused, and **no account is created** — try signing in with it	
2.3	BOTH	S3	On sign-up, follow the Terms and Privacy links	Both open real pages, not a 404	
2.4	TEST	S2	In onboarding, press **Skip for now**	Reaches the app. The dashboard says setup is unfinished	
2.5	TEST	S2	After skipping, sign out and back in	Returns you to setup. The skip lasts one visit only	
2.6	TEST	S2	After skipping, press **Finish setup** on the prompt	Opens **onboarding**, not the dashboard	
2.7	TEST	S3	Complete onboarding, then open `/onboarding` directly	Sent away — a finished account should not be able to re-enter	

3. Brand kit

ID	Env	Sev	Do	Should	Result
3.1	TEST	S2	On a **brand-new** account, go to Brand Kit and upload a logo **without saving first**	Uploads. It must not demand a save first	
3.2	BOTH	S3	Save colours, name, address, licence number	Persist across a reload	
3.3	BOTH	S3	Leave the licence number blank and save	Refused, and the message **names the missing field**	
3.4	BOTH	S3	Upload an **SVG** logo, then publish a poster and send yourself a campaign	The poster still appears in the email. An SVG logo used to drop it entirely	

4. Posters

ID	Env	Sev	Do	Should	Result
4.1	BOTH	S2	Templates > **Use template**	Editor opens with your brand already applied	
4.2	BOTH	S2	Edit text, move and resize something, wait, reload	Changes survived — it autosaves	
4.3	BOTH	S3	Press **Apply pharmacy info**	Name, address and phone fill the placeholders	
4.4	BOTH	S3	Export to PDF from the ... menu	A real PDF downloads. **Not** a blank tab, and not the word `null`	
4.5	TEST	S3	Export as a **Free** account	The poster carries a watermark. On Starter and Pro it must not	
4.6	BOTH	S2	Leave a poster as **Draft**, then try to build a campaign with it	Refused. Draft means not for patients	
4.7	BOTH	S2	Publish a poster, **Archive** it, then try to send it	Also refused	
4.8	TEST	S3	As a **Free** account, create a 6th poster	Refused — Free is 5. Starter is 30, Pro unlimited	
4.9	BOTH	S2	Set a **Booking link** on your **Brand Kit**, then put `{{booking_url}}` on a poster and export it	The address prints. No `{{` anywhere on the page	
4.10	BOTH	S1	On a poster that carries a booking QR, export it and **scan the code with a phone**	It opens your booking page. Scanning is the only real test — a QR that looks fine and goes nowhere is indistinguishable by eye	
4.11	BOTH	S2	Clear the booking link on your Brand Kit, then export that poster again	The code is gone, leaving a gap. It must not print a square that scans to nothing	
4.12	BOTH	S2	Change your booking link, then re-export a poster you made before the change	The new address. Posters follow the brand kit, so an old one never points at a dead page	
4.13	BOTH	S2	Open **Profile** and look at the booking link	It shows the link you set in Brand Kit, with a link across to change it. There must be no second box to type it into here — one value, one place that writes it	
4.14	BOTH	S1	With no booking link set, open a poster and press the **QR** button in the editor toolbar	It takes you to Brand Kit rather than doing nothing. A disabled button with a tooltip is a dead end: the tooltip may never show, and following it means knowing where Brand Kit is	
4.15	BOTH	S3	Put that same poster on a display screen and look at the wall	The same code as the printed one — screens and exports share one render	

5. Contacts

ID	Env	Sev	Do	Should	Result
5.1	TEST	S2	Add a contact by hand	Appears in the list	
5.2	TEST	S2	Import a small spreadsheet	A line-by-line report: added, skipped, or rejected **with the row number and the reason**	
5.3	TEST	S2	Import a file containing the same person twice — once matching on email, once on phone	Both caught as duplicates. Matching is on email **or** phone, not just email	
5.4	TEST	S3	As Free (50 contacts), import a file that would exceed the limit	It says which rows did not fit. It must not silently drop them	
5.5	BOTH	S2	Build a list of 60+ contacts, then **Export**	The file contains **all** of them — not just the page on screen	
5.6	BOTH	S1	Add a contact whose name starts with =, +, - or @. Export, open in Excel	The cell shows the text. It must **not** run as a formula. A leading tab in the cell is the guard working, not corruption	
5.7	BOTH	S3	Group contacts, then filter by group	Counts match what the list shows	

6. Campaigns

Use **your own email address** as a manual recipient throughout.

ID	Env	Sev	Do	Should	Result
6.1	BOTH	S1	Build a campaign with a published poster and send it to yourself	Arrives. The **poster is in the body of the email**, not an attachment	
6.1a	TEST	S1	In that email, right-click the poster and copy its address, then open it in a private browser window	It loads the poster. On a deployed environment the design must be a **link**, not an embedded image — that is what keeps a large campaign sendable, so an embedded one is S1. Locally it will be embedded on purpose; see 6.1d	
6.1b	TEST	S2	Open the same email with images turned off, or in Outlook on a work machine	A **Not showing?** link under the space where the poster is. Following it shows the design	
6.1c	TEST	S3	Change one character in the copied poster address and load it	Refused. It must not serve an image for an address that was not signed	
6.1d	BOTH	S1	Check the API log for the campaign you just sent	On a deployed environment: no warning about `Public:ApiBaseUrl`. If one appears, the poster is being copied into every recipient's message and a large campaign will time out — set `Public__ApiBaseUrl` and send again before testing anything else in this section	
6.2	BOTH	S2	Look at the From line and the footer	Your **pharmacy's name**, not "Marketing25" and not a blank	
6.3	BOTH	S2	Open it on a phone	No sideways scrolling; the poster fits the width	
6.4	BOTH	S3	View it with images blocked	Still readable — there is a plain-text part	
6.5	BOTH	S2	Attach up to 5 videos and send	Thumbnails show; the links work for 48 hours	
6.6	BOTH	S1	Send to **8 or more** recipients at once	All of them arrive. This is the case that used to fail with a large poster	
6.7	BOTH	S2	Open the campaign's delivery report	Per-recipient success or failure with timestamps	
6.8	BOTH	S3	On a failed campaign, press **Retry**	Retries. Not offered on a stopped campaign, or on one everybody received	
6.9	TEST	S2	As a **Free** account, try to send	Refused with an upgrade prompt — Free has 0 recipients	
6.10	BOTH	S3	Enter a malformed address as a recipient	Refused before sending, naming the bad one	
6.11	BOTH	S1	Send to 250 recipients (use a spare domain, not real patients)	A confirmation step first, saying the number. Then **Queued**, then **Sending** with the count climbing, then **Sent**	
6.12	BOTH	S1	During 6.11, close the tab and reopen the campaigns page	The send carried on. It is not stuck at the number it was on when you closed it	
6.13	BOTH	S1	Start another 250 and press **Stop** while it says Sending	Stops. The count may rise by up to 20 more, then stays put. The status stays **Stopped** — refresh twice and check it has not turned into Sent	
6.14	BOTH	S1	Open the stopped campaign's delivery report	Everyone reached is listed as sent, by address; the rest are still pending. Nobody appears twice	
6.15	BOTH	S2	Find a campaign that reached some but not all of its list	A **Send to remaining N** button, with N the number missed. Pressing it emails only those N	
6.16	TEST	S1	On **Starter** (500/month), send 400, then immediately try to send 200 more without waiting for the first to finish	The second is refused, naming the 500 limit. Queued recipients count against the allowance	
6.17	BOTH	S3	Try to send more than 1,000 recipients in one campaign	Refused, with the cap named and a suggestion to split it	

7. In-pharmacy screens

Full walkthrough in `DISPLAY_SCREENS.md`. Requires Starter (1 screen) or Pro.

ID	Env	Sev	Do	Should	Result
7.1	TEST	S2	As a **Free** account, open Screens and try to **add** one	Refused: *"In-pharmacy screens are not part of the Free plan."* Starter gets 1, Pro unlimited. Note the page itself opens — the refusal only comes when you add. If that reads as a dead end rather than an upgrade prompt, report it as S3	
7.2	BOTH	S2	Add a poster that is still a **draft** to a playlist	Refused, saying it must be published first	
7.3	BOTH	S3	Put the same poster **twice in a row** in a playlist	Refused — on a wall that reads as the screen having frozen	
7.4	BOTH	S3	Set a dwell time of 1 second, then 400	Both refused. The range is 3–300 seconds	

ID	Env	Sev	Do	Should	Result
7.5	BOTH	S2	Register a screen, then open `/display` **in a private window**	The pairing box, **not** a sign-in form. A normal tab shares your session and proves nothing	
7.6	BOTH	S1	Type the six-character code	Pairs, and the loop starts within a few seconds	
7.7	BOTH	S1	**Pair a second screen** on the same account, right after the first	Also pairs. The second screen paired in a database used to fail with a server error	
7.8	BOTH	S2	Type the same code again on another device	Refused. Codes work once	
7.9	BOTH	S3	Wait for a code to expire, or press **New code**	The old one stops working. Codes last four hours	
7.10	BOTH	S2	Edit the playlist and save. Do not touch the device	It picks up the change within about 30 seconds, unprompted	
7.11	BOTH	S2	Unpublish a poster that is on a screen	It leaves the loop on the next poll, and shows struck through in the editor as *Not published — skipped*	
7.12	BOTH	S1	**Revoke** the credential from the Screens page	The device returns to the pairing box on its next poll	
7.13	BOTH	S3	Disconnect the device's network	It keeps looping from cache, with a small amber dot	
7.14	BOTH	S3	Check the **Last seen** column	Says *Live* for a running screen; a time for one switched off	
7.15	BOTH	S2	Press **Direct link**, open it on a device	Pairs without a code. Shown **once** and never again	
7.16	BOTH	S2	Register a screen, then look at it on the Screens page **straight away**	**Both** buttons are there — the pairing code control *and* **Direct link**. Direct link used to be hidden until the code expired, i.e. hidden for the whole installation	
7.17	BOTH	S2	In a playlist press **Add video**	Only your **Ready** videos are listed — nothing still making, failed, or being changed. A video row shows its length and *plays once*, with no seconds box	
7.18	BOTH	S2	Save a playlist with a poster and a video, on a **landscape** screen	The video plays **once, muted**, as a centred column with black either side — **not stretched, not cropped** — then the loop moves on. The address strip is hidden while it plays. The Screens page shows a *1 video* badge	
7.19	BOTH	S2	Same, on an **iPad or Mac in Safari**	The video plays. (Safari refuses video from a server that ignores ranges — a black slot here is an S1)	
7.20	BOTH	S2	Start a change to that video (refine) while it is on a screen	It leaves the screen within ~30 s, shows *Not ready — skipped* in the playlist, and comes back when the change finishes	
7.21	TEST	S3	Try to add an 11th video to one playlist	**Add video** is disabled with *Up to 10 videos per playlist*	
7.22	BOTH	S3	Disconnect the device's network with a video in the loop	Posters keep looping from cache; the video either plays from the browser's cache or is skipped. Never a broken or frozen frame	

8. Branches and head office

ID	Env	Sev	Do	Should	Result
8.1	TEST	S2	Sign in as `riverside@example.test` and open **Branches**	Its three branches are listed	
8.2	BOTH	S3	Read the page	It says **branch** / **branches** throughout. Not "sub-pharmacy"	
8.3	BOTH	S1	Switch to a branch	The header names it **in amber** — you are not working as yourself	
8.4	BOTH	S1	Create a poster while switched, then switch back	It belongs to the **branch**, not to you	
8.5	BOTH	S1	Sign out **while switched to a branch**	Fully signed out. Not still authenticated as the branch	
8.6	BOTH	S1	Open a branch you do not manage, by editing the URL	Refused	
8.7	BOTH	S3	Sign in as a pharmacy with no branches	No branch tools offered	
8.8	BOTH	S2	Request access to another pharmacy by email address	Creates a request. It grants **nothing** until an admin approves	

9. Videos

ID	Env	Sev	Do	Should	Result
9.1	TEST	S3	Generate a video from a topic	Progress updates; a 15-second vertical clip in 30–60 seconds	
9.2	BOTH	S3	Try each of the five free voices	All work	
9.3	TEST	S3	As **Free**, try to generate	Refused — Free is 0 per month. Starter 5, Pro 30	
9.4	BOTH	S3	On a failed render, press retry	Re-runs and does **not** charge the monthly quota again	
9.5	BOTH	S4	Download a finished video	Plays, and is 9:16	
9.6	BOTH	S3	Attach one photograph on the create dialog, then generate	The photo appears in the finished video — the opening shot. The rest is stock footage. The estimate does **not** go up	
9.7	BOTH	S3	Try to attach a photo over 8MB	Refused **immediately**, before any upload, naming the file and its size. Not "could not be attached"	
9.8	BOTH	S4	Try to attach a PDF, an SVG or an iPhone `.heic`	Refused: JPEG, PNG or WebP only. SVG is refused here even though the brand-kit logo accepts one	
9.9	BOTH	S4	Attach 5 photos	The fifth is refused; four is the limit	
9.10	BOTH	S3	On a finished video, *Ask for a change* > *Choose pictures* > add one	Re-cuts with it in. The words and the voice are unchanged, it costs nothing, and it does **not** use another video from the allowance	
9.11	BOTH	S3	Repeat 9.10 on a video that already has photos	They are **added**, not replaced. Refused past four in total, saying how much room is left	
9.12	BOTH	S4	Open *Ask for a change* on a video made with **AI imagery**	The *add pictures* control is not offered. Adding one would mean regenerating every other picture, which the plan pays for	
9.14	BOTH	S3	Attach a **landscape** photo. Drag it left and right, then drag up and down	Moves across only. Dragging up/down does nothing, and there is no *Down* slider	
9.15	BOTH	S2	Same photo: set **Zoom** to 60%, generate	Much more of the width is visible in the thumbnail, with a blurred copy of the photo above and below — no black bars, no stretching. The finished video's shot matches the thumbnail	
9.16	BOTH	S3	Attach a phone photo taken **upright** (portrait)	Upright in the thumbnail **and** in the finished video. It used to render on its side	
9.17	BOTH	S3	Ctrl + scroll (or pinch on a trackpad or phone) over a photo	Zooms, between 50% and 150%. An ordinary scroll over it still scrolls the dialog	
9.18	BOTH	S3	Repeat 9.15 via *Ask for a change* > *Choose pictures*	Same controls, same result	
9.19	BOTH	S4	Open a video made before zoom existed, *Ask for a change* on the words only	Its photos look exactly as they did. Old videos are not reframed	
9.20	BOTH	S2	Attach four photos on a laptop (or shrink the window to ~700px tall)	The dialog scrolls, and *Generate* can be reached. Each Zoom slider is wide enough to drag	
9.21	BOTH	S3	On a phone, attach a landscape photo, then swipe up over it	The dialog scrolls. A sideways drag moves the photo	
9.22	BOTH	S1	On a finished video, *Ask for a change*: "make the captions bigger"	A plan is shown saying the captions will change, free. **Not** "We could not work out what to change"	
9.23	BOTH	S3	Ask for "make it about flu instead"	Told it needs the words rewritten and that this is not open yet, with the suggestion to make a new video. Not a generic failure	
9.24	BOTH	S3	Watch a video whose script says the same sentence at the start and the end	That caption appears once	
9.25	BOTH	S1	Ask for a change that cannot be made (e.g. "add music")	When it finishes, a message says the change wasn't made and why, and the card shows "Last change not made: ...". It must not just reload the same video in silence	
9.26	BOTH	S1	On a **new** video with one of your photos, ask "make the captions bigger"	Bigger captions. Your photo is still there, at the same moment, and every other shot is where it was	
9.27	BOTH	S2	On a new video, name a shot by what you can see ("the person washing their hands") and ask for something else there	That shot changes. The other shots do not	
9.28	BOTH	S3	Ask to replace one of your own photos by describing it	Told to remove it from the video's pictures instead. Not a silent re-cut	

ID	Env	Sev	Do	Should	Result
9.29	BOTH	S2	Generate three videos on a narrow topic (few stock matches) and watch each	No shot appears twice back to back. If a clip must repeat, it shows a different part of the clip, not the same frames	
9.30	BOTH	S2	On a video with a repeated shot, ask "remove the duplicate video"	The later repeat is replaced with something that fits what is being said; the first stays; nothing else changes	
9.31	BOTH	S1	New video with two photos. Ask "change the last shot to a pharmacist giving a flu jab"	The last moment becomes footage of that. The first photo and the middle shots are unchanged. Ask a second change: the replaced photo does not come back	
9.32	BOTH	S2	Add a picture to a finished video in a way that fails (e.g. stop the ai-service mid-render), then ask a shot change	The video stays Ready. The added picture is not treated as part of the video	
9.35	BOTH	S1	New video. *Ask for a change*	Every shot is a tile with a still, a time and its caption line; the count matches the shots you see when it plays. Your photo is labelled	
9.36	BOTH	S1	Tap the last tile, type "a person stepping on a scale", *Change this shot and re-cut*	Only the last shot changes, to that. No preview, no refusal about what the shot "shows". Free: the allowance does not move	
9.37	BOTH	S2	Tap a tile and leave the box empty	That shot changes to something on the video's own topic	
9.38	BOTH	S2	Type "replace the one with medicine with a salad" (no position)	Refused with "Tap the shot you want to change...". Nothing re-cut	
9.39	BOTH	S2	Type "change the last shot to people walking"	The last shot changes	
9.40	BOTH	S3	Open *Ask for a change* on a video made before this release	Tiles are numbered, not stills, and still work. After one change, stills appear	
9.41	BOTH	S3	Change a shot, then reopen *Ask for a change* straight away	The changed tile shows the new still, not the old one	
9.33	BOTH	S1	New video on any topic. Count the shots while it plays, then ask "change the last shot to <something>"	The shot count equals the number of caption lines: no extra clips after the last line. The last shot changes, whatever it showed	
9.34	BOTH	S2	Ask "change the second shot to ..."	The second shot changes; no refusal about what it "shows"	
9.13	BOTH	S2	Delete a video that had the **brand logo** pinned into it	The video goes. The logo is still on the brand kit and on every poster using it	

10. Plans and billing

ID	Env	Sev	Do	Should	Result
10.1	BOTH	S3	Open Pricing	Free £0, Starter £7/mo, Pro £25/mo	
10.2	BOTH	S3	Check the usage counters, then open Design with AI	Counters show posters, videos and recipients used this month; Design with AI shows the AI designs left this month	
10.3	TEST	S2	Upgrade a throwaway account	Limits lift immediately	
10.4	TEST	S3	Downgrade an account that has screens registered	Existing screens keep running. That is deliberate — blanking a shop window over a billing change would be worse	
10.5	BOTH	S2	As a head office, switch into a branch and open Plan & Billing	The branch's plan is shown with a note that only its own account holder can change it. No "Choose" buttons, no top-up packs, no "Manage billing" link	
10.6	BOTH	S2	Switch back to your own pharmacy and open Plan & Billing	Your own plan buttons and "Manage billing" are back	

10a. Social accounts

ID	Env	Sev	Do	Should	Result
10a.1	BOTH	S1	**After any change of web address** (a new domain, `www`, a new environment): connect one Facebook page from Social & Ads, signing in for real	Facebook returns to the app and the page appears as connected. "URL Blocked" means the address's `/social/callback/meta` is missing from Facebook Login > Valid OAuth Redirect URIs — the one thing `pnpm smoke` cannot read	

ID	Env	Sev	Do	Should	Result
10a.2	BOTH	S2	Open Social & Ads as a pharmacy that was already connected	Still connected, no reconnect asked for. Otherwise the encryption key changed (`pnpm smoke` readiness: "social tokens")	
10a.3	BOTH	S2	Connect **LinkedIn**, sign in, keep your profile ticked, **Connect**	The profile is listed as *LinkedIn profile*. A blank 400 page straight after signing in is LinkedIn's own sign-in page: press Connect again	
10a.4	BOTH	S2	**Share to social** on a published poster > tick the LinkedIn profile > **Publish now**	Posts > History shows **Published** with a `linkedin.com/feed/update/...` link that opens the post. Delete it on LinkedIn afterwards — LinkedIn posts are public	
10a.5	BOTH	S3	Same with a Ready video to LinkedIn	Published within a few minutes (LinkedIn processes the video first)	
10a.6	BOTH	S3	A caption with brackets, an @, an underscore and a #`hashtag`, e.g. "Open (till 9pm) @ the counter #FluJab"	Appears on LinkedIn exactly as typed; the hashtag is a link	
10a.7	BOTH	S3	Connections tab, LinkedIn account	No expiry note until 14 days before the 60-day sign-in ends; then *The sign-in expires on ...* with **Reconnect**. Reconnect keeps the same connection (no duplicate)	
10a.8	TEST	S2	Connect **YouTube** with a test-user Google account that owns a channel (API set to `Social__Google__YouTubePrivacy=unlisted`)	The channel is listed. YouTube is not offered when sharing a poster	
10a.9	TEST	S2	Share a Ready video to YouTube with a short first caption line	**Published** with a `youtu.be/...` link; the first line is the title. Private until Google audits the project	
10a.10	BOTH	S2	Disconnect an account, then share a poster	The account is gone from the list and from the share dialog; scheduled posts to it fail with "disconnected"	
10a.11	BOTH	S3	Press **Cancel** on the platform's consent page	Back in the app: "You cancelled the connection. Nothing was changed."	
10a.12	BOTH	S2	Connect **TikTok** as a sandbox target user whose TikTok account is set to private	The account is listed as *TikTok*. A TikTok error page instead usually means the redirect URI or client key in the TikTok app is wrong	
10a.13	BOTH	S2	**Share to social** on a Ready video > tick TikTok	A TikTok box shows the account's nickname; **Who can see this post** has nothing chosen; Comment, Duet and Stitch are off (greyed if switched off in TikTok); Publish is disabled until an audience is chosen. TikTok is not offered for a poster	
10a.14	BOTH	S2	Choose **Only me** > **Publish now**	**Published** after TikTok processes it (no link for a private post); the video is in the TikTok app	
10a.15	BOTH	S3	Turn on **Disclose commercial content** > **Branded content** with **Only me**	Refused: branded content cannot be private. "Only me" is greyed; the consent line mentions the Branded Content Policy	
10a.16	BOTH	S3	Tick two TikTok accounts on one post	"Choose one TikTok account per post" and Publish is disabled	
10a.17	BOTH	S3	Try to add TikTok to a recurring post	Not offered (and refused by the API): TikTok wants each post chosen by a person	
10a.18	BOTH	S2	Connect **X**, sign in, **Authorize app**	The account is listed as *Name (@handle)*. An X error page instead usually means the callback URI in the X app is not `.../social/callback/x`, or the app is not a Web App	
10a.19	BOTH	S2	**Share to social** on a published poster > tick X > **Publish now**	An *X: n / 280* line appears under the caption. **Published** with an `x.com/i/web/status/...` link showing the poster. Delete it on X afterwards	
10a.20	BOTH	S3	Same with a Ready video to X	Published within a few minutes (X processes the video first)	
10a.21	BOTH	S2	With X ticked, a caption over 280, or a short one with ten links	The X line turns red ("too long for X") and Publish is disabled. Untick X: Publish is allowed again	
10a.22	BOTH	S3	Publish the exact same caption to X twice	The second fails with "the same text is already on this account"	
10a.23	BOTH	S3	Try to add X to a recurring post	Not offered (and refused by the API): X refuses repeated text, and a series repeats its caption	

10b. Recurring posts

ID	Env	Sev	Do	Should	Result
10b.1	BOTH	S2	As **Free**, open Social & Ads > Recurring	"Not included in your plan" with See plans. No way to create one	
10b.2	BOTH	S2	As **Starter**, create a weekly series (poster, Facebook or LinkedIn, Mon and Thu 09:00)	Review shows the next dates in your time zone; after saving, the list and 14-day calendar show them	
10b.3	BOTH	S2	As Starter with 2 active series, try a third	Refused with the plan limit; Pause one and it is allowed	
10b.4	TEST	S2	A daily series a few minutes from now	Posts at the time; Recent shows a tick; the pharmacy gets the "posted" email (unless set to problems only)	
10b.5	BOTH	S2	**Pause**, then **Resume**	Nothing posts while paused; history is kept; resumes from the next future date (nothing sent late)	
10b.6	BOTH	S3	**Edit** the time of an active series	Only future posts move; past results unchanged	
10b.7	TEST	S2	Disconnect one of two accounts on a series	The other account still gets each post; disconnecting the last pauses the series and emails why	
10b.8	BOTH	S3	**Make recurring** from a poster's or video's menu	The stepper opens with that poster or video chosen	
10b.9	BOTH	S3	**End** a series	It shows Ended and cannot be resumed; posts already sent stay	

10c. Lists: sort and date

ID	Env	Sev	Do	Should	Result
10c.1	BOTH	S3	On My Posters choose **Oldest first** and **Last 7 days**	The list changes; the address bar carries `sort=oldest&from=...&to=...`; reloading or sharing the link keeps the view	
10c.2	BOTH	S3	Choose a **Custom** range with nothing in it	*No results in this date range* with a button that clears the filter	
10c.3	BOTH	S4	Repeat on Templates, Videos, Campaigns, Contacts and the admin users, pharmacies and audit tables	Same toolbar and behaviour everywhere	

11. Things that must never happen

Run these last, deliberately. Every one is S1.

ID	Env	Sev	Do	Should	Result
11.1	BOTH	S1	Copy a poster URL from pharmacy A. Sign in as B. Open it	Refused	
11.2	BOTH	S1	Same for a campaign, a patient, a playlist and a screen	All refused	
11.3	BOTH	S1	As a pharmacy, open `/admin`	Refused. A signed-in pharmacy is not an administrator	
11.4	BOTH	S1	Paste a kiosk display URL into a normal browser and change the poster id in it	Refused. A screen reaches only its own playlist	
11.5	BOTH	S1	On a screen playing a video, copy the video's address (devtools > Network > `/api/display/video/...`) and swap in the id of another of your videos, keeping `sig`	Refused (403). The link opens that one video only, and contains neither the screen token nor a storage key	
11.5	BOTH	S1	Anywhere in the app, look for another pharmacy's name or contact in a list, a count or a dropdown	Never appears	
11.6	TEST	S1	Create a video with `images: [{ blobKey: "posters/<another pharmacy's id>/<poster>.png" }]` posted by hand	Refused. The key is sent by the caller, and it is used twice — the worker downloads it, and deleting the video deletes it — so a trusted key would render their picture into your video and destroy their file when you tidied up. Every key must sit under your own `videos/{you}/attachments/`, `posters/{you}/` or `brand/logos/{you}/`	
11.7	TEST	S1	Same, on POST `/api/videos/{id}/pictures` for a finished video	Refused identically. Both doors take a blob key from the request body, so both check it	

12. The whole window

Quick sweep, on every page you visited.

ID	Env	Sev	Do	Should	Result
12.1	BOTH	S3	Open the account menu and the pharmacy switcher	Solid panels. Not see-through with text showing through	
12.2	BOTH	S3	Scroll a long page with a banner showing	The banner and the page header do not overlap	
12.3	BOTH	S2	Click every link in the sidebar and the footer	Every one reaches a real page	
12.4	BOTH	S3	Watch for spinners	None that never resolve	
12.5	BOTH	S3	Resize to a phone width	Nothing scrolls sideways; nothing is cut off	
12.6	BOTH	S4	Read the product name everywhere	**Marketing25** throughout — including poster templates, email footers and page titles
